IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re Application of

STEVEN C. JOHNSON et al.

HP Docket No. 10003562-1

Serial No.

09/909,501

Examiner G. Neurauter

Filed

July 20, 2001

Group Art Unit 2143

For

ELECTRONIC SERVICE TRANSACTION AND METHOD

Commissioner for Patents P. O. Box 1450 Alexandria, Virginia 22313-1450

Sir:

DECLARATION UNDER § 1.131

We declare as follows:

- We are inventors who, on July 20, 2001, filed the above-identified application. At the time of invention of the subject matter set forth in such application, we were employees of Hewlett-Packard Company.
- In the December 27, 2005 Office action, the Examiner cites U.S.
 Publication No. 2002/0163662 to Kaufman et al. in rejecting all claims of the above-identified application.
- 3. U.S. Publication No. 2002/0163662 to Kaufman et al. claims the benefit of U.S. Provisional Application Serial No. 60/287,761 (filed May 1, 2001), and is a continuation-in-part of U.S. Patent Application Serial No. 09/642,538 (filed August 18, 2000).

Page 1 - DECLARATION UNDER § 1.131 Serial No. 09/909,501

HP Docket No. 10003562-1 KH Docket No. HPCC 3E2 4. Applicants expressly do <u>not</u> concede that either U.S. Provisional

Application Serial No. 60/287,761, or U.S. Patent Application Serial No. 09/642,538,

fully discloses the subject matter in U.S. Publication No. 2002/0163662 to Kaufman et

al., or the subject matter claimed in the above identified application.

5. Prior to August 18, 2000, the earliest possible effective date of U.S.

Publication No. 2002/0163662 to Kaufman et al., we conceived of our invention, and

diligently worked toward reducing our invention to practice.

6. Exhibit 1, an HP Invention Disclosure form for an invention entitled "A

Printer That Can Initiate (and Possibly Complete) an E-Service Transaction", was

prepared prior to August 18, 2000, the earliest possible effective date of U.S.

Publication No. 2002/0163662 to Kaufman et al.

7. At the time of preparing Exhibit 1, which preceded August 18, 2000, we

had conceived of an electronic service transaction apparatus, comprising: a

computer peripheral device having a communication link with an electronic service

site; and a messaging system configured to communicate between the computer

peripheral device and the electronic service site and operative to enable sending and

receiving of at least one of messages and information between the computer

peripheral device and the electronic service site, wherein the communication link

connects the computer peripheral device with the Internet, and the computer

peripheral device is configured to initiate an electronic service transaction with the

electronic service site through self-access of the messaging system.

Page 2 -

DECLARATION UNDER § 1.131 Serial No. 09/909,501

HP Docket No. 10003562-1

KH Docket No. HPCC 3E2

8. We also had conceived a computer peripheral device, comprising: an

output engine; a transaction execution subsystem communicating with the output

engine; a communication interface communicating with the transaction execution

subsystem; and processing circuitry communicating with the transaction execution

subsystem and operative to initiate an electronic services transaction through self-

access from the transaction execution subsystem using the communication interface

via an external network with an electronic services provider.

We also had conceived a method of initiating an electronic services

transaction, comprising: providing a computer peripheral device having a

communication link with an electronic service site and an interface system for

initiating an electronic service transaction between the computer peripheral device

and the electronic service site; detecting a need to initiate an electronic computer

peripheral servicing transaction from the computer peripheral device with an external

electronic service site; and initiating the electronic computer peripheral servicing

transaction in response to the detected need using the computer peripheral device.

10. Following our conception prior to August 18, 2000, we diligently worked

toward reducing our inventions to practice, and on July 20, 2001, filed the present

patent application.

All acts set forth herein and/or relied upon for the purpose of 11.

establishing invention prior to August 18, 2000 were carried out in the United States.

Description of Invention

235039729115

Very soon, e-services will be abundant on the internet. This disclosure proposes the initiation of e-service transactions at the printer, This invention consists of:

- 1) Any e-service
- 2) A printer
 - a) connected to the internet
 - b) capable of initiating (and possible carrying out) an e-service transaction

Background

Prior Solutions and Disadvantages

Services are currently available on the internet. Customers can use a browser to access web-sites to find information, purchase goods, etc. However this model has several disadvantages:

- 1. These transactions are initiated manually by the user, through a web browser on the PC.
- 2. If the transaction is printer related, the user must be informed that a service exists and where to find it on the internet.
- 3. If the transaction is printer related, the user must know details about his particular printer model and configuration.
- 4. If the transaction is printer related, the user must track his own behavior and anticipate his own future needs.
- 5. Even if the transaction is printer related, the user chooses which services to conduct business with. His choice may not necessarily coincide with his exact printer model. Therefore, the printer manufacturer may not realize any financial advantage from this model. Also, the goods purchased may not be compatible with the user's exact printer model and configuration.

New Solution

This disclosure proposes the initiation (and possible completion) e-service transactions at the printer. This invention consists of:

Any c-service

Such an e-service will provide services either for free or for a fee. These e-services may or may not be print-related. The possibilities for e-services are nearly endless. Some examples of print-related e-services might include but are not limited to: scheduling maintenance, upgrading firmware, ordering consumables, downloading and/or printing manuals or other documents, upgrading the driver itself. Some examples of non-print-related e-services might include but are not limited to: sending an e-mail to the system administrator, getting the latest stock quote for your favorite stock, gotting the latest weather report, etc.

- 3) A printer
 - a) connected to the internet

This invention requires the shiftiry for the printer to access (or cause another process to access) the internet to connect to and initiate a transaction with an e-service. This access could be provided through a dial-up access method, dedicated internet connection, or any other mechanism.

b) capable of initiating (and possible carrying out) an e-service transaction

The printer is able to determine what e-service transaction(a) to initiate and when best to initiate the transaction. This could be based on 1) user input - where the user navigates menus on the printer's control panel or otherwise causes the printer to initiate eservice, 2) print-time printer state - where at print-time the driver initiates an e-service transaction based on the state of the printer and/or the contents of the current print job, or 3) statistical analysis - where the driver tracks the user's behavior over a period of time or over a set of print jobs to determine the user's needs. The e-service transaction could be initiated by a) simply launching a

Fonts distributed electronically disclosure

☎5039729115

printer-based web browser and pointing it to an e-service site where the user completes the transaction, b) connecting to the eservice and carrying out the entire transaction automatically with no user interaction, or c) any combination of a and b.

Example 1:

- 1. Suppose an e-service exists to render web pages and return them as PCL5 or PostScript print streams. (See related disclasure, 'Universal Document Translation e-Service")
- 2. Suppose the user's printer is connected to the internet, and the user can point the printer to some document or web page on the internet and request that it be printed.
- 3. The printer would send the URL for the document or web page to the e-service and request that it be sent back to the printer as a print stream.

 4. The printer prints the document or web page.

Example 2:

- 1. Suppose an e-service exists to sell laser printer toner. Normally, the user would have to learn that such a site exists (from print advertisements, television advertisements, etc.), and manually point his web browser to the site to conduct a transaction.
- Suppose the user's printer is configured to access the internet.
- Suppose the user's printer is instrumented to monitor the toner level in its cartridge.
- The user configures the primer to automatically order toner from the e-service when the toner level falls to a certain level.
- When the preset toner level is reached, the printer automatically connects to the e-service, and orders a the new toner cartridge

Advantages of New Solution

- E-services are made accessible without the need for a PC or other host computer.
- Transactions can be initiated at the place and time of need.
- The printer can be pre-configured to know where certain e-services exist on the internet.
- Print related transactions can be initiated by the printer, which has access to must or all of the information necessary to trigger (and possible carry out) a transaction, such as printer model and configuration, state of the printer, contents of the current or past jobs, etc.
- The printer could track the user's behavior to determine which transactions to initiate and when to initiate them.
- E-services are made available to the user through a printer that he already has installed.
- Certain e-services to use can be pre-set to those provided by the printer's manufacturer, allowing that manufacturer to realize the financial advantages from the e-service.
